

ABSTRACT OF THE DISCLOSURE

The present invention discloses an apparatus for packaging and containing an object, comprising a lower compartment with a plurality of sections, each comprising two or less crevices; a lower fixing segment formed between the
5 sections; an upper casing having a folded line integrally extended to one side of the lower compartment, and its dimension being responsive to the lower compartment, and having a latch hole at the intersection with the lower compartment; an outer casing, being integrally extended from another side of the lower compartment, and an external latch plate being disposed on the outer side of
10 the outer casing responsive to the latch hole; and a wrapping section, being extended from the outer side of the external casing, and its outer side having a wrapping latch plate, such that an object can be fixed when passing through the bottom of the lower fixing segment. After the upper casing covers on the lower compartment and the wrapping section folds and covers the upper casing, the
15 wrapping latch plate will latch the wrapping latch hole.
